AI Knowledge Updates

How the FrameworX AI tools get their knowledge assets: the documentation index and the solution context document.

Knowledge Assets

The AI tools (Designer MCP, Console MCP and Runtime MCP servers) use two knowledge assets:

- **Documentation index** — the offline index of this documentation site, used by the `search_docs` tool. Page titles, sections, tags and content snippets.
- **Solution context document** — the architecture, syntax rules and display specifications an AI session loads when it opens a solution.

Both assets are built from the current product documentation and **ship inside the product installer**. They are refreshed with every product update; installing an update is the only way they change.

No Between-Release Downloads

The product does not check this site, or any other server, for newer knowledge assets. The AI tools read only the files installed with the product, so a machine without internet access has exactly the same AI knowledge as a connected one, and the behavior of a given product build is the same on every machine.

Earlier preview builds described an automatic, between-release download of these assets from this page. That mechanism is retired and no asset is published here.
