Report Namespace Reference

Access report state and operations via scripts.

The **Report Namespace** exposes runtime report state to .NET scripts. Use **`@Report`** to reference the namespace, followed by the accessors listed below.

Report Members

Report Members

Direct properties and methods on `@Report`.

Member	Kind	Type	Description
`form`	Property	`ReportsForms`	Gets the collection of every ReportForm configured in the solution — RTF-based templates with tag expressions in the body that get resolved at save time and rendered to the file format selected on the row (PDF, RTF, HTML, plain text). Indexed by Form name (e.g., @Report.Form.BatchSummary) or numeric ID; enumerable in foreach.
`webData`	Property	`ReportsWebData`	Gets the collection of every ReportWebData object configured in the solution. Each entry is a row in the WebData editor and represents a REST / GraphQL / MCP-HTTP endpoint, with tag-resolved URL, headers, authorization and request/response handling. Indexed by name (e.g., @Report.WebData.WeatherApi) or numeric ID; enumerable in foreach.

Member set generated from FrameworX 10.1.5. For the full .NET API surface see the external Report Namespace .NET API Reference.
