> MultiplePopups.tproj

- **Project Name:** MultiplePopups
- **Software Version:** 9.2 sp2 (9.2.26)
- **Keywords:** Display. MultiplePopups. Popups With Parameters.

Project Summary

Example showing different ways to open a **Popup** in a project.

The example also shows how to create reusable **Popup Displays** that can be opened side by side, mapping to different tags in the application.

Technical Information

This example shows how to open **multiple** instances of the same popup window, using the **OpenDisplay** Script, **NewPopup** Script, and using the **Run Expression** action.

In order to allow each instance to map dynamically to different tags, the **NewPopup** method requires specific parameters. The CodeBehind of the mainpage **Display** has the script example for that method call.

Reference Information

See "[Multiple Display](#)" and "[Multiple Popups](#)" for more information.
